It's time to get comfortable.™

- **Test your air conditioner before the weather gets hot!** As soon as the outside temperature is 70 degrees or above, turn on your air conditioner. Measure the temperature of the air at your register. This should be between 50-60 degrees. Have your air conditioner serviced if the temperature is above 60 degrees. This will **prevent being without air conditioning the first hot day!**
- **Change the air filter on your furnace.** Use a high efficiency pleated filter. 1" or 2" thick filters should be changed at least twice per year (spring & fall). 3-4" filters can be changed only once per year (spring).
- **Wash the condenser coil.** The outside unit should be washed with a garden hose each spring. Let the unit dry for at least 4 hours before turning on.
- **Clean drain line.** This is the drain line attached to the evaporator coil. The evaporator coil is usually installed above your furnace (Basement installation).
